

"Confirmed field is missing" option not available

1 Why can't I select the confirmed missing option in my form?

- Confirming that a field is missing is a built in feature in Clinic. It is always available as an option for all variables, unless the variable has been set to optional in the design. An optional question doesn't need a confirmation why it is missing.

By default all items are set as "required" in the design so normally no special configuration is needed to have this option enabled.
