"Confirmed field is missing" option not available

1 **Why can't I select the confirmed missing option in my form?**

- Confirming that a field is missing is a built in feature in Clinic. It is always available as an option for all variables, <u>unless</u> the variable has been set to optional in the design. An optional question doesn't need a confirmation why it is missing.

  By default all items are set as "required" in the design so normally no special configuration is needed to have this option enabled.
